FM Synthesis MIDI Player (Fmmidi) is a sound synthesizer application for converting MIDI files and reproduces the sound of a

specific original sound system into a set of simple data called "FM". In FM Synthesis MIDI Player (Fmmidi), the music data of a MIDI file is converted into a set of simple data called "FM". In addition, it is possible to reproduce the sound of a virtual sound source by artificially changing the "FM" (Figure 1). Figure 1 : MIDI data and FM data. The FM data of an original sound source that is played with a hardware sound source, such as a drum sound, is converted into simple data called FM. In FM Synthesis MIDI Player (Fmmidi), use the "FM" to reproduce the

sound of a drum. However, does not mean that it is to be aligned with the sound of the hardware sound source. It is possible to change the sound of the drum by changing the frequency and FM data. Using FM data, the software can be played as a "real drum." In addition, "FM" has a width of 100 points at 100% and a depth of 30 points at 100%. Therefore, using a variety of sounds, you can change the tone of the drum. In addition, if the volume of the "FM" is too low, you can increase the volume of the "FM". In addition, if the volume of the "FM" is too high, you can reduce the

volume of the "FM." It is possible to change the speed of playback by changing the interval of "FM". It is possible to create a keyboard pattern MIDI file using the "FM" data. In addition, it is possible to play the same instrument part over and over again. If you are interested in the sound of the original sound source, you can check the "Tabular" view. If you are interested in the tabular data, you can check the "Display" view. For information on the program, contact Fujitsu Corporation. Previous versions: The most recent version is 4.0.2.
