A: You need to remove the leading space of the \$ref.
Your Regex is this String p1 =
Regex.Replace(p, @"(?
m.Groups[1].Value); String p2
= Regex.Replace(p, @"(?
m.Groups[1].Value); String p3

= Regex.Replace(p, @"(?
m.Groups[1].Value); It works
and returns String p1 =
"cristian c.respuesta.w3c.org/2

Galceran Gil de.Q: How to
close a Tkinter window, but
without closing the Python

interpreter? In a script, I would like to execute a function, then close a Tkinter window. Here's the function:

```
def pbmod_error(self): """  
    Script who handles error  
    message, and ask user to re-  
    login and retry the module """  
    tkMessageBox.showinfo(self,  
"Derby Server Error:", "Please  
    re-login and retry the  
Module") self.server.destroy()
```

`self.server.mainloop()` The issue is that, everytime I execute this function, the Python interpreter gets blocked when closing the Tkinter window, not being able to execute any command line. How to close the window and still keep the Python interpreter? A: Look into `Toplevel():` #Modify the code according to your

```
requirements myToplevel =  
    Toplevel()  
myToplevel.title('Text') button  
= Button(myToplevel, text =  
    'ok', command = lambda:  
    myToplevel.destroy())  
    button.pack()  
myToplevel.wait_window()
```

To get the output for the
button press you can call the
command handler and from
there you have access to the

Toplevel instance as well as other goodies Happy Earth 3e33713323
