If you want to learn Photoshop, but you're a beginner or just want something simpler,

this infographic is perfect for you. This is how you learn Photoshop. The invention relates to a device for detecting contamination of an injectable filling material in a medical patient by using a magnetizable substance. A device for detecting contamination of an injectable filling material in a medical patient is disclosed in German published specification (DE-PS) No. 3,209,272. This conventional device comprises two sensor units which are each secured in a housing in such a way that one is immovably fastened on the housing of

the other unit. Each sensor unit is provided with a receiving coil which surrounds a magnetized coil core. The sensor unit, which is disposed close to the patient, has a magnetizable plug which is intended for insertion into the injection syringe. At the end of the magnetizable plug facing away from the patient, the plug has a deformable ring. The plug is intended to deform if an object enters the plug and to thus produce electrical pulses which serve as an indication of contamination. The plug of the second sensor unit is of the same type. In the known

device, provision is made for the sensor units to be embodied as plug-in units which can be inserted one into the other. This permits a simple exchange or cleaning of the sensor units. In this device, the sensor units are always positioned in front of one another. Each plug-in unit is therefore always located at a predetermined distance from the other plug-in unit so that the plug of the first plug-in unit does not obstruct the magnetic field of the second plug-in unit. In this device, the only consideration is for the plug of the first plug-in unit not to fall into

the injection syringe. This means that if a patient moves more than a few millimeters, e.g. as occurs during breath when a respiration gas is introduced, then the plug, which is not movably fastened, is not prevented from falling into the syringe, since it is only secured by magnetic force to the housing of the first sensor unit. A device for detecting contamination of an injectable filling material in a medical patient is disclosed in U.S. Pat. No. 3,911,911. In this device, the filler material is magnetized by means of a permanent magnet in such a way

that the resulting magnetic field has a shape
which is suitable for displacing a detector

This invention relates to mechanisms which slow down or stop a vehicle in response to sensed brake pressure in the vehicle. Over-speed control devices for vehicles are well known. Typically, such devices sense the vehicle speed and generate a control signal based on this sensed vehicle speed. The control signal is generally used to slow the vehicle down and/or bring it to a halt. As is known, such control devices generally include a wheel decelerator which engages

the driving wheels of the vehicle, and engages the vehicle braking system and the engine, to decrease the vehicle speed. Such devices can be located in the vehicle engine or in a separate, electrical or hydraulic system. For example, U.S. Pat. No. 3,031,785 to Miller et al. teaches a vehicular stop system in which the vehicle may be brought to a standstill in response to a deceleration of the vehicle. The patent discloses that the system is responsive to a deceleration of a first magnitude greater than the maximum deceleration of a first

vehicle speed. The system then utilizes a signal of the first magnitude to obtain the desired control action. In addition, the system applies power to the vehicle brakes. Many similar devices have been invented by others over the years. One such device is taught in U.S. Pat. No. 3,566,782 to Wiesehorn. In Wiesehorn, the wheel decelerators are located in the vehicle engine and engage the vehicle engine.

Notwithstanding the foregoing, there is still room for improvement in the devices of the prior art. For example, many known over-

speed and stop control systems utilize the engine to apply the braking force to the vehicle wheels. The application of the braking force to the wheels of the vehicle may induce an unstable or erratic condition during a stop. Other known over-speed and stop control systems utilize a separate hydraulic or electrical system. This requires an on-board source of energy such as a battery or electric power supply. These systems are potentially more sensitive to vehicle weight or load which may vary widely, and there is a possibility of

undesirable battery drain.Q: Not able to build Qt project in Windows 10 I am attempting to build the Qt project 'fileserver' that I downloaded from the Qt website.
